

1 **ABSTRACT**

2 A request is received to play an audio file. A determination is made
3 regarding whether volume normalization parameters associated with the audio file
4 are stored in a media library. If the volume normalization parameters associated
5 with the audio file are stored in the media library, the volume normalization
6 parameters are retrieved from the media library. If the volume normalization
7 parameters associated with the audio file are not stored in the media library,
8 retrieving the volume normalization parameters from the audio file. The volume
9 normalization parameters are applied while playing the audio file. The volume
10 normalization process can be applied across multiple audio files during playback.
